

**IN THE ABSTRACT:**

Please amend the Abstract as shown below:

--A method ~~for transferring~~ing data from a data source to multiple data sink objects ~~is disclosed~~. The data acquired from the data source is encapsulated into a data object. ~~The~~ Identification information of the data object is posted to a data server. The data server shares the identification information with the data sink objects that are registered with the data server. The data sink objects access the data object with the identification information at execution time. A counter ~~is provided with the data object to~~ indicates the number of the data sink objects that currently use the data object. The data object is removed from the memory of the computer systems when the counter indicates ~~displays information~~ that the data object is no longer used by the data sink objects. Alternatively, the data object that is no longer used ~~by the data sink objects~~ may be stored in a separate memory location of the computer systems for a future use. —
